Fig. 1 Adjusted means for mental well-being and health harming behaviour outcomes by ACE count category and trusted adult support in childhood. ACE=Adverse Childhood Experiences. Graphical representations have been limited to ≥4 ACEs and 0 ACE categories for clarity of presentation. 95% CI = 95% Confidence Intervals. Adjusted means are calculated using estimated marginal means function and are adjusted through logistic regression modelling for confounding from other variables in the model; here age, sex, ethnicity (see Methods). Deprivation quintiles are from 1 = most affluent to 5 = most deprived.
