Improved Procedures for the Transport and Storage of Fruit and Vegetables

A thesis submitted to Bangor University by Karen Harper in candidature for the degree of Doctor of Philosophy

School of Environment, Natural Resources and Geography
Bangor University
Bangor
Gwynedd
LL57 2UW

May 2014
Abstract

Natural methods (biocontrol) for the preservation of harvested fruits and vegetables were investigated. This was in order to potentially help the industry overcome the environmental problems and pathogen resistance being encountered with the use of synthetic fungicides.

The main focus of research was the use of volatile compounds found in citrus fruit. These were utilised in in vivo studies with citrus fruit artificially inoculated with *Penicillium digitatum* and *P. italicum*, as well as strawberries inoculated with *Botrytis cinerea*. The extent of pathogen growth was measured after exposure to the volatiles for a number of days (7 for citrus fruit and 3 for strawberries) in environmentally-controlled containers. The ‘freshness’ of the fruit was also ascertained via measurements of water/weight loss. The essential oil of orange itself was highly effective at reducing *Penicillium* growth (> 30% inhibition) and water/weight loss in the fruit (> 20% reduction), as were some of its individual components - (E)-2-hexenal, neryl acetate and linalool. The aldehyde (E)-2-hexenal also had high efficacy against *B. cinerea* and reduced water/weight loss in strawberries, although in these investigations the ketone, (R)-carvone was the most effective overall (> 30% mean pathogen inhibition and > 35% mean reduction in water/weight loss).

Organic and non-organic fruit were utilised in the in vivo experiments and discrepancies were observed in the results for each type. In vitro studies were therefore conducted with the volatiles, both alone and in combination with commercial fungicides (imazalil, thiabendazole and fludioxonil) in amended-agar investigations. Aldehydes (including (E)-2-hexenal) displayed the highest efficacy against *Penicillium species* and *B. cinerea* (> 90% inhibition), followed by carvone and methyl salicylate (> 40% inhibition). These observations were repeated in the fungicide-amended-agar work, where it was shown that these volatiles could be utilised to supplement the activity of synthetic fungicides and therefore reduce their overall use within the industry.

Chitosan was also investigated as a biological coating for harvested fruit. At 2% concentrations it reduced water/weight loss in oranges compared to uncoated fruit, whilst at 0.1% it reduced *Penicillium* infection in inoculated fruit by almost 50%. Acid and enzyme hydrolysis techniques were performed to obtain chitooligosaccharides with a degree of polymerisation (DP) of 3-10, reported to possess superior antifungal properties than commercially-available chitosan. The hydrolysates were analysed via MALDI-TOF-MS. Chitooligosaccharides produced by one of the acid hydrolysis methods and one obtained using the enzyme Laminarinase were found to be of the desired DP.

Overall, the work revealed the potential of some alternative methods for maintaining the freshness and extending the storage-life of fresh fruits. A number of citrus volatiles were found to be effective at reducing pathogen growth as well as protecting the fruit from water/weight loss. They were also found to operate in parallel with synthetic fungicides, thus implying that the domination of these chemicals in the post-harvest industry could be diminished by combined applications. Chitosan as an edible coating for fresh produce has also been shown to have potential, although additional work is required to elucidate this further.

Chapter Five
The Effect of Volatile Compounds on Botrytis cinerea Infection and Water Loss in Strawberry Fruits

5.1: Introduction
5.2: Materials and Methods
  5.2.1: Fruit Material
  5.2.2: Pathogens
  5.2.3: Chemicals
  5.2.4: Incubation Conditions
  5.2.5: Inoculation of Fruit
  5.2.6: Volatile Delivery Method
  5.2.7: Data Collection and Analysis
5.3: Results
  5.3.1: Organic Strawberries and Volatiles
  5.3.2: Non-organic Strawberries and Volatiles
5.4: Discussion

Chapter Six
Effect of Citrus Volatiles on the Growth of Botrytis cinerea in vitro

6.1: Introduction
6.2: Materials and Methods
  6.2.1: Media
    6.2.1.1: Standard agar
    6.2.1.2: Amended Agar – ascertaining MIC
    6.2.1.3: Amended Agar - MIC50
  6.2.2: Pathogens
    6.2.2.1: Initial Isolation and Identification
    6.2.2.2: Maintenance of Cultures
    6.2.2.3: Fungal Suspensions
  6.2.3: Chemicals
  6.2.4: Inoculation of Media and Volatile Delivery Method
  6.2.5: Data Collection and Analysis
6.3: Results
  6.3.1: Botrytis cinerea and Volatiles
  6.3.2: Botrytis cinerea and Amended Agar – MIC establishment
  6.3.3: Botrytis cinerea, Amended Agar and Volatiles
6.4: Discussion

Chapter Seven
The Effects of Chitosan and/or Pectin Coatings on Orange fruit, Plus Chitosan Hydrolysis and Analysis

7.1: Introduction
7.2: Materials and Methods
  7.2.1: Chemicals
  7.2.2: Fruit material
  7.2.3: Pathogens
  7.2.4: Organic Oranges with Chitosan and/or Pectin Coatings
7.2.4.1: Preparation of Coatings 112
7.2.4.2: Incubation Conditions 112
7.2.4.3: Inoculation of Fruit 112
7.2.4.4: Volatile Delivery Method 112
7.2.4.5: Date Collection and Analysis 112
7.2.5: Chitosan Hydrolysis and Analysis 113
  7.2.5.1 Mass Spectrometry 113
  7.2.5.2: Acid Hydrolysis of Chitosan with Hydrogen Chloride 114
    Method a. 114
    Method b. 114
  7.2.5.3: Enzyme Hydrolysis of Chitosan with Pepsin 115
  7.2.5.4: Enzyme Hydrolysis of Chitosan with Amano Lipase A 115
  7.2.5.5: Enzyme Hydrolysis of Chitosan with Laminarinase 116

7.3: Results 117

  7.3.1 The Effects of Chitosan Coatings on Weight/Water Loss in Orange Fruit 117
  7.3.2: The Effects of Chitosan Coatings on Weight/Water Loss and Penicillium Infection in Orange Fruit 118
  7.3.3: The Effects of Chitosan or Pectin Coatings Plus Volatile Compounds on Weight/Water Loss and Penicillium Infection in Orange Fruit 119
  7.3.4: MALDI-TOF-MS Analyses 123
    7.3.4.1: Inulin and Commercial Chitosan 123
    7.3.4.2: Chitosan Oligosaccharides Produced by Acid Hydrolysis 126
    7.3.4.3: Chitosan Oligosaccharides Produced by Enzyme Hydrolysis 133

7.4: Discussion 141

Chapter Eight

General Discussion and Conclusions 147

Chapter Nine

Acknowledgements

I would like to like to acknowledge the following people:

My supervisors, Professor Deri Tomos, Dr Mike Hale and Dr Radek Braganca, as well as my company supervisor Dr Owen Jones. Thank you for all your support and guidance, all the time that you have spent with me, and all your encouragement and expertise. This work would not have been possible without you.

KESS for funding the Ph.D. project and the BioComposites Centre for allowing me to use their facilities. I would particularly like to thank Dr Olga Tverezovskaya and Dr Viacheslav Tverezovskaya for their help with the chitosan hydrolyses.

My good friend and fellow Ph.D. student, (the now Dr) Rosie Anthony for being there with support, laughs and cake. Also my amazing friend Emma Fenwick Newcomb, who believed in me and kept me going through thick and thin, mostly with coffee and calamitous adventures.

My wonderful partner, Andy Maudsley and all my family, particularly my children Claire, John, Donna, Tara and Warren, my brother Kevin, and my Mum. You’ve always believed I could succeed, even when I didn’t, and for that I shall always be grateful.

Lastly, I would like to dedicate this to my late father, Alexander Harper, whom I miss so very much. I know you’d be proud, Dad.
