Abstract

The preparation of [NMC][B₅O₆(OH)₄] {NMC = 2-MeC₃N₂H₄ (3), 1-MeC₃N₂H₄ (4), 4-MeC₃N₂H₄ (5), 1,2-Me₂C₃N₂H₃ (6), 1,2,3-Me₃C₃N₂H₂ (7), 1-EtC₃N₂H₄ (8), 2-EtC₃N₂H₄ (9), 2-Et-4-MeC₃N₂H₃ (10) 1-Et-3-MeC₃N₂H₃ (11) and 2-iPrC₃N₂H₄ (12)} salts are reported. Compounds were characterized by spectroscopy (NMR and IR) and by single crystal XRD (6, 7, 9, 10, 12) studies. All structures show extensive H-bonded networks and 7 displays the first example of reciprocal paired αααα anion-anion interactions. These are facilitated by the pentaborate boroxole rings being significantly distorted (boat) from the near-planar arrangements more commonly observed. The related imidazolinium salt, [2-MeC₃N₂H₆][B₅O₆(OH)₄] (13), has also been characterized by XRD studies. Compound 13 is isostructural with 3. Thermal properties (TGA/DSC) indicate decomposition to B₂O₃ via [NMC][(B₅O₈)ₙ] intermediates.

Keywords: borate; pentaborate; polyborate; imidazolium; X-ray structures; H-bonding.
1. Introduction

There are many known examples of polyborate salts with either metal or non-metal cations (NMCs), and they exhibit great structural diversity [1,2]. Polyborate anions are classified as either 'condensed', containing polymeric chains, layers, nets etc, or as 'isolated' with well defined anionic entities [3]. Both systems may be prepared from aqueous solution although more forcing conditions are often required for the condensed systems [4]. Within the isolated systems, polyborate anions containing three [5,6], four [7,8], five [9], seven [10-13], eight [14], nine [15,16], fourteen [17] and fifteen [18] B atoms have been obtained. Of these the [NMC][B\textsubscript{5}O\textsubscript{6}(OH)\textsubscript{4}] salts are well-known (see below), but most other NMC polyborate salts are limited to just a few examples of each class. It is becoming increasingly apparent that crystalline polyborate products which are formed are more strongly influenced by H-bonding interactions and crystal packing forces than by reaction conditions/reactant stoichiometry since many polyborate species co-exist in aqueous solution as a consequence of rapidly attained equilibria [19,20].

Literature reports of nonaborate(3-) salts are limited to [C\textsubscript{3}N\textsubscript{2}H\textsubscript{5}]\textsubscript{3}[B\textsubscript{9}O\textsubscript{12}(OH)\textsubscript{6}] (1) and [C(NH\textsubscript{2})\textsubscript{3}]\textsubscript{3}[B\textsubscript{9}O\textsubscript{12}(OH)\textsubscript{6}] (2) which contain imidazolium(1+) and guanidinium(1+) cations, respectively [15,16]. As part of a continuing study relating to the thermal properties of NMC polyborates [6,13,21] we were interested in preparing more examples of these rare non-metal cation salts with nonaborate anions (Figure 1) and have investigated the synthesis of polyborate salts derived from related imidazolium cations. However, for the reason described above we were unable to isolate further examples of these nonaborate salts but we successfully prepared a number of salts containing pentaborate anions (Figure 1). The synthesis, characterization and thermal properties of these new pentaborate salts form the basis of this manuscript.
2. Results and Discussion

2.1 Synthesis and characterization

Characterization data reported for 1 and 2 are limited to single-crystal XRD studies and elemental analyses [15,16]. We successfully re-synthesised these two compounds by the literature method [15], with bulk samples of satisfactory elemental analysis data. Spectroscopic data for these compounds are discussed below and are reported in the experimental section. IR spectroscopic analysis has been described as an under-rated tool for polyborate structural analysis, and detailed literature assignments have been made for monoborate through to hexaborate species [22]. IR data for 1 (and 2) are given in the experimental section and tentative B-O assignments for 1 can be made, by visual comparison with [Imid]Cl for elimination of imidazolium cation peaks. Compound 1 (and 2) shows 3 peaks in the region 1300-1400cm\(^{-1}\), assigned to \(\nu_{as}(B(3)-O)\), and a further strong signal centered at 1050cm\(^{-1}\), assigned as \(\nu_{as}(B(4)-O)\). In addition, both compounds show bands at 943cm\(^{-1}\) and 890cm\(^{-1}\), assigned as \(\nu_{s}(B(3)-O)\), and the higher energy band of these two is sharper may be diagnostic of the \([B_9O_{12}(OH)_{6}]^{3-}\). A band at 815cm\(^{-1}\), probably \(\nu_{s}(B(4)-O)\), is also apparent in IR spectra of both compounds. It can be noted that the band which we have assigned as characteristic of \([B_5O_6(OH)_4]^{-} (\sim 925cm^{-1})[23]\), and assigned to \(\nu_{s}(B(3)-O)\), is present in 3-13, and absent in 1 and 2.

The attempted syntheses of a series substituted tris(imidazolium) nonaborate(3-) salts by Schubert's method (3:1 ratio, high temperature) were all unsuccessful and resulted in materials which were identified as substituted imidazolium pentaborate(1-) salts. The substituted imidazolium cations used in this study are illustrated in Figure 2. The products were obtained in low yields but increasing the B(OH)\(_3\):imidazole ratio to 5:1 resulted in the formation of these pentaborate(1-) salts in higher yields. This method has
been previously used to prepare [2-MeC₃N₂H₄][B₅O₆(OH)₄] (3) and other non-metal cation pentaborate salts [21]. The unsubstituted imidazolium pentaborate, [C₃H₅N₂][B₅O₆(OH)₄] has been synthesized by a solvothermal method [24]. The new substituted imidazolium pentaborate salts 4-12, synthesised according to Eqns 1 and 2 were obtained in reasonable yields and had satisfactory elemental analysis data. The related imidazolinium salt, [2-MeC₃N₂H₆][B₅O₆(OH)₄] (13), with a saturated cyclic ethane linkage, was also synthesized by the method in Eqn 1.

(Eqn. 1) Imid' + 5B(OH)₃ → [Imid'H][B₅O₆(OH)₄] (4-6, 8-10, 12, 13) + 5H₂O
{Imid'H = 1-MeC₃N₂H₄ (4), 4-MeC₃N₂H₄ (5), 1,2-Me₂C₃N₂H₃ (6), 1-EtC₃N₂H₄ (8), 2-EtC₃N₂H₄ (9), 2-Et-4-MeC₃N₂H₃ (10), 2-iPrC₃N₂H₄ (12), 2-MeC₃N₂H₆ (13}).

(Eqn. 2) [Imid][OH] + 5B(OH)₃ → [Imid][B₅O₆(OH)₄] (7, 11) + 6H₂O
{Imid = 1,2,3-Me₃C₃N₂H₂ (7), 1-Et-3-MeC₃N₂H₃ (11}).

The ionic structures of 6, 7, 9, 10, 12 and 13 were confirmed by single-crystal X-ray studies (see section 2.3). Spectroscopic and thermal data are reported in the experimental section and NMR and IR data for the X-ray determined structures were in accord with their crystallographic structures and data for 3, 4, 5, 8, 11, and 13 were comparable. ¹¹B NMR spectra showed peaks at +18, +13 and +1ppm consistent with equilibria linking monoborate/polyborate species [19,20] as has been observed before for pentaborates in aqueous solution [21]. ¹H and ¹³C NMR spectra were in accord with their formulated structures with NH and BOH protons producing a broad signal at ~+4.7ppm. IR spectra for all pentaborates showed the diagnostic band at ~925cm⁻¹ [23]. The ¹H and ¹³C NMR spectra of the cation in 13 is consistent with a 'planar' structure [25].
2.2 Thermal properties

The thermal decomposition properties (in air) of compounds 4-13 were studied by TGA and DSC. Heating samples in air to 1000°C resulted in dark glassy solids and the residual masses obtained were consistent with production of B₂O₃ from [B₅O₆(OH)₄]⁻. DSC traces indicated that the decomposition steps below 250°C were endothermic and those above 250°C were exothermic. This is consistent with previous observations [15,26,27], which have shown the thermal decomposition generally occur via a series of steps involving dehydration (endothermic) and oxidation (exothermic), as shown in Eqns 3 and 4.

(Eqn. 3) \[ \text{[NMC][B}_5\text{O}_6(OH)_4] \rightarrow \text{[NMC][B}_5\text{O}_8] + 2\text{H}_2\text{O} \]

(Eqn. 4) \[ \text{[NMC][B}_5\text{O}_8] \rightarrow 2.5\text{B}_2\text{O}_3 + \text{oxidation products} \]

2.3 XRD Structural studies

The formulated ionic structures of 6, 7, 9, 10, 12 and 13 were confirmed by single crystal XRD studies. Crystallographic data are given in Table 1 and full details are available in supplementary data. All structures contained the expected substituted imidazolium(1+) cations or the imidazolinium(1+) cation partnered with a pentaborate(1-) anion. All compounds showed extensive H-bonded anion-anion interactions and the cations in 6, 7 and 12 were disordered over 2 sites. Compound 6 was crystallized with 1 water of crystallization. The co-crystallization of small molecules such as H₂O or B(OH)₃ within the anionic lattice is not uncommon and these additional molecules serve as 'spacer' molecules which expand the H-bonded lattice [13,14,26,28].

Bond lengths and bond angles associated with the boroxole rings of the pentaborate anions found in 6, 9, 10, 12 and 13, are generally in accord with literature data for other
[NMC][B₅O₆(OH)₄] structures [21,26,29,30] and do not significantly differ from organo-substituted boroxole ring systems [31-33] containing both 3- and 4-coordinate B atoms bound to O. These structures need no further comment other than noting that the H bond interactions arising from the pentaborate donor sites are \( \alpha \alpha \beta \omega \) for 6 and \( \alpha \alpha \alpha \beta \) for 9, 10, 12 and 13, where \( \alpha \) and \( \beta \) are pentaborate acceptor sites, and \( \omega \) is an H₂O acceptor site [13,14]. In all cases the \( \alpha \)-interactions are through \( R₂^2(8) \) reciprocal pairs [34]. The \( \alpha \alpha \alpha \beta \) motif is commonly observed in herringbone or brickwall structures [14,21] and compound 9 has a herringbone structure. The C(8) \( \beta \)-interaction for 9 is shown in Figure 3. The \( \beta \)-interactions in 10 and 12 are through \( R₂^2(12) \) reciprocal pairs (Figure 4), rather than the C(8) interactions. The cations in 3 and 13 have very similar volumes and steric requirements and differ by only 2H atoms, and as a result the crystallographic data for 13 is very similar to that which has been previously reported for 3 [21]. The imidazolinium ring in 13 is crystallographically planar with eclipsed H atoms at saturated carbons with a C-C distance of 1.529(2)\( \text{Å} \) which is significantly longer than the distance found in the imidazolium salt 3 (1.328(4)\( \text{Å} \)) [21] and the other substituted imidazolium compounds reported here, 1.336(8)-1.350(6)\( \text{Å} \). Compound 13 (and 3) have \( \alpha \alpha \alpha \beta \) configurations with the imidazolenium cations bridging two pentaborates at \( \beta \)-acceptor sites via two donor H-bonds.

A drawing of the structure of 7 is shown in Figure 5. The anions link in a giant H-bonded lattice and their method of linkage (\( \alpha \alpha \alpha \alpha \)) is unusual and has not been observed previously. The cations, which are unable to participate in H-bonding, sit within the anionic lattice, and in order to accommodate the \( \alpha \alpha \alpha \alpha \) configuration, the boroxole rings of the pentaborate(1-) anions are significantly distorted from the near-planar arrangements more commonly seen. A view of the H-bonded interactions for 7 around each pentaborate anion is shown in Figure 6. Both boroxole rings of the pentaborate
anion are in boat conformations as evidenced by the central B1 atom and the transannular O2 atom of one ring being 0.353 and 0.111 Å above the least square plane for O1B2O3B3, with the hydroxyl O atoms O7 and O8 below the plane by 0.104 and 0.183 Å, respectively. Similarly, B1 and transannular O5 are located 0.368 and 0.128 Å above the least square plane of O4B4O6B5, with the hydroxyl O atoms (O9 and O10) below this plane by 0.188 and 0.152 Å respectively. More importantly, O5 is located 1.519 Å above the plane of O1B2O3B3 (in other boroxole ring), and O2 is 1.596 Å above the plane of O4B4O6B5 (other boroxole ring), confirming a significant twist to the anion, since these would be expected to be within these planes in a non-distorted system. Despite the significant twist to the pentaborate structures the boroxole ring B-O bond lengths [1.351(3)-1.392(3)Å B(sp²); 1.464(3)-1.482(3)Å B(sp³)], OBO angles [109.7(2)-110.6(2)°, B(sp³); 115.4(2)-123.9(3)°, B(sp²)] and BOB angles [119.1(2)-112.0(2)°] remain within the normal ranges associated with pentaborate systems [14,21,29,30], including 6, 9, 10, 12 and 13.

3. Experimental

3.1 General

Chemicals were commercially available and used as supplied. NMR spectra were obtained on a Bruker Avance-500 spectrometer using XWIN-NMR 3.5. $^{11}$B, $^1$H and $^{13}$C spectra were obtained on samples dissolved in D$_2$O at 160, 500, and 125 MHz, respectively. FTIR spectra were obtained as KBr pellets on a Perkin-Elmer 100FTIR spectrometer. TGA and DSC were performed on an SDT Q600 instrument using Al$_2$O$_3$ crucibles with a ramp rate of 10°C per minute (RT to 1000°C in air). X-ray crystallography was performed at the EPSRC national crystallography service centre at Southampton University. CHN analyses were obtained from OEA Laboratories
Compounds 1, 2 and 3 were obtained by a literature procedures [15,21]. The syntheses of the new pentaborate salts (4-13) are all very similar and representative methods are given for 4 and 7 below.

3.2 Synthesis, spectroscopic, thermal and analytical data

3.2.1 Imidazolium nonaborate [15], [C₃N₂H₅]₃[B₉O₁₂(OH)₆], (I). Yield = 1.5g, 36% from 3.6g B(OH)₃. XRD: [d-spacing/Å (% rel. int.): 6.94 (100), 3.58 (93), 3.49 (75), 3.90 (52), 3.81 (51). Elemental anal. Calc. for C₉H₂₁B₉O₁₈N₆: C 18.1%, H 3.5%, N 14.0%. Found: C 18.2%, H 3.6%, N 14.0%. ¹H/ppm: 4.7 (12H), 7.05 (6H, s), 7.92 (2H, s). ¹³C/ppm 120.81 (2CH), 135.06 (CH). ¹¹B/ppm: 1.1 (<1%), 13.2 (5%), 18.1 (95%). IR (KBr/cm⁻¹): 3366(m), 3271(m), 3159(m), 2998(m), 2854(m), 1591(m), 1386(s), 1348(s), 1303(s), 1189(m), 1131(m), 1108(s), 1056(s), 996(m), 942(m), 887(s), 815(m), 778(m), 750 (m), 702 (m), 628 (s), 477 (m). TGA: loss of H₂O at 190°C, 12.1% (12.0% calc for 4H₂O); residue at 700°C 56.0% (52% calc for 4.5B₂O₃).

3.2.2 Guanidinium nonaborate [15], [C(NH₂)₃]₃[B₉O₁₂(OH)₆], (2). Yield = 3.1g, 82% from 3.7g B(OH)₃. XRD: [d-spacing/Å (% rel. int.): 3.56 (100), 4.41 (22.7), 3.47 (13.9), 4.96 (13.0), 4.03 (10.2). Elemental anal. Calc. for C₉H₂₄B₉O₁₈N₉: C 6.3%, H 4.23%, N 22.1%; Found: C 6.4%, H 4.5%, N 22.1%. ¹H/ppm: 4.7 (br). ¹³C/ppm: 154.4. ¹¹B/ppm: 13.7. IR (KBr/cm⁻¹): 3432(s), 3197(s), 1686(s), 1655(s), 1571(m), 1405(s), 1351(s), 1294(s), 1216(w), 1145(m), 1130(m), 1052(s), 1031(s), 945(m), 895(m), 814(m), 755(w), 700(m), 526(m). TGA: loss of H₂O at 250°C, 19.0% (18.9% calc for 6H₂O); residue at 700°C 53.0% (54.8% calc for 4.5B₂O₃).

3.2.3 1-Methylimidazolium pentaborate, [1-MeC₃N₂H₄][B₅O₆(OH)₄], (4). B(OH)₃ (7.43g, 121.80mmol) was dissolved in a warm MeOH/H₂O (100ml, 1:1) 100ml. 1-Methylimidazole (2.00g, 24.36mmol) was added to the solution which was warmed for 1h. The solvent was removed by rotary evaporation and the resulting solid was dried at
110°C for 24h to yield product as a white solid (7.03g, 96%). Elemental anal. Calc for C₄H₁₁B₅N₂O₁₀: C 16.0%, H 3.7%, N 9.3%. Found: C 16.0%, H 3.7%, N 9.2%. 

**1H/ppm:** 3.75 (3H, s), 4.71 (5H, s), 7.2 (2H, s), 8.27 (1H, s). 

**13C/ppm:** 34.1 (CH₃), 120.7 (CH), 121.8 (CH), 135.0 (CH). 

**11B/ppm:** 1.1, 13.0, 18.6. IR (KBr/cm⁻¹): 3379(vs), 3113(m), 1435(vs), 1360(vs), 1103(s), 1026(s), 926(s), 782(m), 697(m), 626(w). TGA: loss of H₂O 15.0% (11.9% calc); residual B₂O₃ 57.0% (57.8% calc).

### 3.2.4 4-Methylimidazolium pentaborate, [4-MeC₃N₂H₄][B₅O₆(OH)₄], (5).

Method as 4, yield = 7.1g, 96% from 7.43g B(OH)₃. Elemental anal. Calc for C₄H₁₁B₅N₂O₁₀: C 15.9, H 3.7, N 9.3%. Found: C 16.4%, H 3.7%, N 9.4%. 

**1H/ppm:** 2.15 (3H, s), 6.92 (1H, s), 4.7 (5H), 8.16 (1H, s). 

**13C/ppm:** 9.1 (CH₃), 116.0 (CH), 130.0 (C), 132.9 (CH). 

**11B/ppm:** 1.1, 13.1, 18.5. IR (KBr/cm⁻¹): 3166(s), 1634(m), 1420(vs), 1309(vs), 1164(s), 1084(m), 1032(m), 916(s), 823(m), 777(m), 699(s), 623(m). TGA: loss of H₂O 15.0% (11.9% calc); residual B₂O₃ 57.0% (57.8% calc).

### 3.2.5 1,2-Dimethyimidazolium pentaborate, [1,2-Me₂C₃N₂H₃][B₅O₆(OH)₄], (6).

Method as 4, yield = 6.21g, 95% from 6.43g B(OH)₃. Elemental anal. Calc for C₅H₁₃B₅N₂O₁₀: C 19.0, H 4.2, N 8.9%. Found: C 19.3%, H 4.2%, N 8.8%. 

**1H/ppm:** 2.42 (3H, s), 3.60 (3H, s), 4.70 (5H, s), 7.09 (2H, s). 

**13C/ppm:** 10.0 (CH₃, s), 33.5 (CH₃, s), 118.7 (CH, s), 122.4 (CH, s), 144.7 (C) 

**11B/ppm:** 1.1, 13.2, 18.8. IR (KBr/cm⁻¹): 3391(vs), 3087(s), 1621(w), 1440(vs), 1341(vs), 1103(s), 1026(s), 925(s), 782(m), 697(m). TGA: loss of H₂O 15.0% (16.2% calc); residual B₂O₃ 52.0% (52.2% calc). Recrystallisation from H₂O yielded crystals of 6.H₂O suitable for XRD studies.

### 3.2.6 1,2,3-Trimethyimidazolium pentaborate, [1,2,3-Me₃C₃N₂H₂][B₅O₆(OH)₄], (7).

1,2,3-trimethyimidazolium iodide (4.00g, 16.80mmol) was dissolved in water (50ml) and Dowex 550A monosphere (OH⁻ form) was added and the suspension was stirred for 24h. The ion exchange resin was removed by filtration and methanol (50ml) was added to the
filtrate. Boric acid (5.19g, 84.01mmol) was added to the filtrate and the solution was heated for 1h. The solvent was removed by rotary evaporation and solid was dried at 110°C for 24h to yield a pale orange solid (4.31g, 78%). Elemental anal. Calc for C₆H₁₅B₅N₂O₁₀: C 21.9, H 4.6, N 8.5%. Found: C 21.4%, H 4.6%, N = 7.8%. ¹H/ppm: 2.45 (3H, s), 3.65 (6H, s), 4.7 (4H), 7.17 (2H, s). ¹³C/ppm: 8.6 (CH₃), 34.5 (2 x CH₃), 121.7 (2 x CH), 144.6 (C). ¹¹B/ppm: 1.2, 13.0, 19.0. IR (KBr/cm⁻¹): 3378(vs), 3231(vs), 1436(vs), 1358(vs), 1255(m), 1104(m), 1025(m), 923(s), 782(m), 713(w), 652(w).

Recrystallisation from H₂O yielded crystals of 7 suitable for XRD studies.

3.2.7 1-Ethylimidazolium pentaborate, [1-EtC₃N₂H₄][B₅O₆(OH)₄], (8). Method as 4, yield = 7.06g, 96% from 6.43g B(OH)₃. Elemental anal. Calc for C₅H₁₃B₅N₂O₁₀: C 19.0, H 4.2, N 8.9%. Found: C 18.9%, H 4.3%, N 8.6%. ¹H/ppm: 1.35 (3H, t, J = 7.25Hz), 4.06 (2H, q, J = 7.25Hz), 4.7 (5H), 7.17 (1H, s), 7.26 (1H, s), 8.23 (1H, s). ¹³C/ppm: 14.8 (CH₃), 46.6 (CH₂), 120.8 (CH), 122.1 (CH), 134.9 (CH). ¹¹B/ppm: 18.6. IR (KBr/cm⁻¹): 3380(vs), 3072(s), 1440 (vs), 1356(vs), 1258(m), 1102(s), 1025(s), 923(s), 782(m), 713(w), 652(w). TGA: loss of H₂O 13.0% (11.4% calc); residual B₂O₃ 53.5% (55.2% calc).

3.2.8 2-Ethylimidazolium pentaborate, [2-EtC₃N₂H₄][B₅O₆(OH)₄], (9). Method as 4, yield = 6.32g, 96% from 6.46g B(OH)₃. Elemental anal. Calc for C₅H₁₃B₅O₁₀N₂: C 19.1%, H 4.2%, N 8.9%. Found: C 19.4%, H 4.2%, N 8.9%. ¹H/ppm: 1.19 (3H, t, J = 7.5Hz), 2.79 (2H, q, J = 7.5Hz), 4.7 (6H), 7.09 (2H, s). ¹³C/ppm: 10.6 (CH₃), 19.2 (CH₂), 118.8 (2 x CH), 149.4 (C). ¹¹B/ppm: 1.1, 13.2, 18.9. IR (KBr/cm⁻¹): 3350(s), 2995(m), 1624(m), 1399(vs), 1311(vs), 1198(m), 1136(m), 928(vs), 776(m), 701(m). TGA: loss of H₂O 15.0% (11.4% calc); residual B₂O₃ 56.0% (55.2% calc). Recrystallisation from H₂O yielded crystals of 9 suitable for XRD studies.

3.2.9 2-Ethyl-4-methylimidazolium pentaborate, [2-Et-4-MeC₃N₂H₃][B₅O₆(OH)₄], (10). Method as 4, yield = 5.51g, 92% from 5.61g B(OH)₃. Elemental anal. Calc for
$\text{C}_6\text{H}_{15}\text{B}_5\text{N}_2\text{O}_{10}$: C 21.9%, H 4.6%, N 8.5%. Found: C = 22.3%, H 4.6%, N 8.6%. $^1$H/ppm: 1.18 (3H, t, $J = 7.75$Hz), 2.12 (3H, s), 2.76 (2H, q, $J = 7.75$Hz), 4.7 (6H), 6.79 (1H, s). $^{13}$C/ppm: 9.0 (CH$_3$), 10.5 (CH$_3$), 19.1 (CH$_2$), 114.6 (CH), 129.2 (C), 148.3 (C). $^{11}$B/ppm: 1.1, 13.0, 18.6. IR (KBr/cm$^{-1}$): 3420(vs), 3143(s), 1407(vs), 1318(vs), 1196(w), 1078(m), 1027(m), 926(s), 776(m), 706(w). TGA: loss of H$_2$O 10.0% (9.7% calc); residual B$_2$O$_3$ 41.0% (43.4% calc). Recrystallisation from H$_2$O yielded crystals of 10 suitable for XRD studies.

3.2.10 1-Ethyl-3-methylimidazolium pentaborate, [1-Et-3-Me-$\text{C}_3\text{N}_2\text{H}_3$]$[\text{B}_5\text{O}_6(\text{OH})_4]$, (11).

Method as 7, Yield = 3.09g, 90% from 3.24g B(OH)$_3$ and 1-ethyl-3-methylimidazolium bromide. Elemental anal. Calc for C$_6$H$_{15}$B$_5$N$_2$O$_{10}$: C 21.9%, H 4.6%, N 8.5%. Found: C 21.7%, H 4.6%, N 8.2%. $^1$H/ppm: 1.29 (3H, t, $J = 7.7$Hz), 4.12 (2H, q, $J = 7.7$Hz), 4.39 (3H, s), 4.7 (4H), 7.75 (2H, s), 8.92 (1H, s). $^{13}$C/ppm: 15.20 (CH$_3$), 37.0 (CH$_3$), 42.0 (CH$_2$), 122.8 (2 x CH), 137.0 (C). $^{11}$B/ppm: 1.1, 13.3, 18.9. IR (KBr/cm$^{-1}$): 3230(s), 3020(s), 1440(vs), 1357(s), 1255(s), 1110(m), 1025(m), 925(s), 780(m), 710(m). TGA: loss of H$_2$O 13.0% (10.9% calc); residual B$_2$O$_3$ 57.5% (52.5% calc).

3.2.11 2-Isopropylimidazolium pentaborate, [2-Pr-$\text{C}_3\text{N}_2\text{H}_4$]$[\text{B}_5\text{O}_6(\text{OH})_4]$, (12).

Method as 4, yield = 5.51g, 92% from 5.61g B(OH)$_3$. Elemental anal. Calc for C$_6$H$_{15}$B$_5$N$_2$O$_{10}$: C 21.9%, H 4.6%, N 8.5%. Found: C 22.3%, H 4.6%, N 8.6%. $^1$H/ppm: 1.22 (6H, d, $J = 6.9$Hz), 3.13 (1H, sept, $J = 6.9$Hz), 4.7 (6H), 7.08 (2H, s). $^{13}$C/ppm: 19.7 (2 x CH$_3$), 26.6 (CH), 118.9 (2 x CH), 153.1 (C). $^{11}$B/ppm: 1.1, 13.2, 18.9. IR (KBr/cm$^{-1}$): 3414(s), 3147(s), 3021(s), 2932(m), 1623(m), 1405(vs), 1316(vs), 1184 (m), 1067(m), 1023(m), 917(s), 777(m), 719(m). Recrystallisation from H$_2$O yielded crystals of 12 suitable for XRD studies.TGA: loss of H$_2$O 15.0% (10.9% calc); residual B$_2$O$_3$ 51.0% (52.9% calc).

3.2.12 2-Methyl-2-imidazolinium pentaborate, [2-Me-$\text{C}_3\text{N}_2\text{H}_3$]$[\text{B}_5\text{O}_6(\text{OH})_4]$, (13).

Method as 4, yield 7.02g (97%) from 7.35g B(OH)$_3$. Elemental anal. Calc for
C₄H₁₃B₅N₂O₁₀: C 15.8%, H 4.3%, N 9.2%. Found: C 15.9%, H 4.5%, N 9.1%. ¹H/ppm: 1.87 (3H, s), 3.34 (4H, s), 4.7 (6H, s). ¹³C/ppm: 11.6 (CH₃), 44.3 (2 x CH₂), 168.5 (C). ¹¹B/ppm: 1.1, 13.1, 18.9. IR (KBr/cm⁻¹): 3381(s), 1619(m), 1432(vs), 1180(m), 1025(s), 922(vs), 779(m), 704(m), 583(w). TGA: loss of H₂O 15.0% (11.8% calc); residual B₂O₃ 55.0% (57.0% calc). Recrystallisation from H₂O yielded crystals of 13 suitable for XRD studies.

3.3 X-ray crystallography

The crystallographic data collection of compounds 6, 7, 10, 12 and 13 were performed using a Nonius Kappa CCD diffractometer with Mo Kα radiation (λ = 0.71073Å) controlled by the Collect [35] software package and an Oxford Cryosystem N₂ open flow cryostat at 120(2) K. The data were processed using Denzo [36] and semi-empirical absorption corrections were applied using SORTAV [37,38]. The crystallographic data collection for compound 9 was performed on a Rigaku AFC12 diffractometer equipped with an enhanced sensitivity (HG) Saturn724+ CCD detector mounted at the window of a FR-E+ SuperBright rotating anode generator (Mo Kα radiation (λ = 0.71075Å )) equipped with VariMax HF (High Flux) optics at 100(2) K. Software package CrystalClear-SM Expert 2.0 r 13 [39] was used for the cell determination, data collection, integration, scaling and absorption correction. Crystallographic data are given in Table 1. The structures were solved by direct methods and refined by full-matrix least-square procedures on F² using SHELXS-97 and SHELXL-97 respectively [40]. All non-hydrogen atoms were refined anisotropically.

Crystallographic data for 6, 7, 9, 10, 12 and 13 have been deposited with the Cambridge Crystallographic Data Centre with CCDC971516-971521. Copies of this information may be obtained free of charge from the Director, CCDC, 12 Union Road, Cambridge, CB2
4. Conclusions

A series of substituted-imidazolium(1+) pentaborate(1-) salts have been prepared. IR spectra can be used to differentiate between the imidazolium nonaborate (1) and related pentaborates (3-13). The compounds characterized by single-crystal XRD (6, 7, 9, 10, 12 and 13) all show extensive three dimensional H-bonded lattices. The first example of reciprocal-paired $\alpha\alpha\alpha\alpha$ anion-anion interactions is observed in 7 where, in order to accommodate these interactions, the pentaborate boroxole rings are significantly distorted away from planar towards boat conformations. The $\beta$ interactions in 10 and 12 (both $\alpha\alpha\alpha\beta$) are through reciprocal paired $R_2^2(12)$ interactions rather than the more common C(8) chain, observed in 9, 10, and 13. All substituted-imidazolium pentaborate salts are thermally decomposed in air via a multistage process to glassy $B_2O_3$. Thermally derived materials were amorphous and non-porous.

Acknowledgments. We thank the EPSRC for use of the X-ray crystallographic service (Southampton) [41]. We thank the reviewers for their constructive comments.

Figure 1
Schematic drawings of nonaborate(3-) (left) and pentaborate(1-) (right) anions observed in 1,2 and 3-13, respectively.

Figure 2
Schematic drawings of the imidazolium cations partnered with pentaborate anions in 3-12. Elsewhere in the manuscript these compound numbers refer to the [NMC][B$_5$O$_6$(OH)$_4$] salts but the pentaborate anions are omitted for clarity in this Figure.

Figure 3
H-bond interactions: the C(8) chain structure (β-interaction) as found in 9. The H-bond data are $d$(H10…O7) 1.81 Å, $d$(O10…O7) 2.6285(15) Å, angle O10H10O7, 166.2°. Each pentaborate anion also forms 3 additional H-bond interactions to α-sites.

Figure 4
H-bond interactions: the R$_2^2$(12) ring structure (β-interactions) as found in 12. The H-bond data are $d$(H9…O10) 1.84 Å, $d$(O9…O10) 2.6708(18) Å, angle O9H9O10, 167.4°. Each pentaborate anion also forms 3 additional H-bond interactions to α-sites.

Figure 5
ORTEP drawing of [1,2,3-Me$_3$C$_3$N$_2$H$_2$][B$_5$O$_6$(OH)$_4$] (7) showing atomic numbering scheme. The cation is disordered over two sites and the one with highest s.o.f [0.641(7)] is shown. Selected boroxole ring parameters (bondlength, Å; angles, °) are: B1-O1 1.464(3), B1-O3 1.482(3), B1-O4 1.481(3), B1-O6 1.468(3), B2-O1 1.375(3), B2-O2 1.385(3), B2-O7 1.351(3), B3-O2 1.372(4), B3-O3 1.360(3), B3-O8 1.262(4); O1-B1-O3 109.93(19), B1-O3-B3 120.9(2), O3-B3-O2 121.0(2), B3-O2-B2 119.1(2), O2-B2-O1 120.4(2), B2-O1-B1 120.6(2).
Figure 6
Pentaborate lattice for 7 showing the αααα H-bond interactions (data arranged $d$(H…A) (Å), $d$(D…A) (Å), angle DHA (°)): O7-H7…O3’ (α) 1.84, 2.676(2), 170.2; O8-H8…O1’(α) 1.93, 2.745(3), 164.6; O9-H9…O6’(α) 1.92, 2.743(2), 167.0; O10-H10…O4’(α) 1.85, 2.676(2), 167.9.
